Implementing Database Design

From the previous assignment, you now have the diagram with all entities and the relationships between them. The next step would be implementing that design with MongoDB.

Tasks

- Create a [MongoDB Atlas](#) account and set up a new database
- Add [Mongoose](#) Library to your ExpressJS API from the Coders App API assignment
- Connect Mongoose to your database
- Create Models and relationships with Mongoose
- Try adding some dummy data to your database when the server starts running
